

EMBL high-throughput crystallization facility now open

The EMBL-Hamburg Outstation is pleased to announce that its high-throughput crystallization facility is now open to the general user community. The facility conducts experiments as sitting drops with the vapor diffusion method. Users have a variety of choices on available initial screens and set up parameters. Experiments are automatically imaged and results are made accessible via internet. We also offer the possibility to generate optimization screens. For access information and prices please check our web pages under http://www.embl-hamburg.de/facilities/HT-X_Info.html.
